decile_data <- read_excel("GCIPrawdatatest.xlsx", skip = 2)
#The data is now in a 'tibble' (like a spreadsheet for R). Let's use the head function to look at the f
head(decile_data)

## # A tibble: 6 x 14
##   Country Year Decil~1 Decil~2 Decil~3 Decil~4 Decil~5 Decil~6 Decil~7 Decil~8
##   <chr>   <dbl>   <dbl>   <dbl>   <dbl>   <dbl>   <dbl>   <dbl>   <dbl>   <dbl>
## 1 Afghani~ 1980     206     350     455     556     665     793     955    1187
## 2 Afghani~ 1981     212     361     469     574     686     818     986    1225
## 3 Afghani~ 1982     221     377     490     599     716     854    1029    1278
## 4 Afghani~ 1983     238     405     527     644     771     919    1107    1376
## 5 Afghani~ 1984     249     424     551     674     806     961    1157    1438
## 6 Afghani~ 1985     256     435     566     692     828     987    1189    1477
## # ... with 4 more variables: `Decile 9 Income` <dbl>, `Decile 10 Income` <dbl>,
## # `Mean Income` <dbl>, Population <dbl>, and abbreviated variable names
## # 1: `Decile 1 Income`, 2: `Decile 2 Income`, 3: `Decile 3 Income`,
## # 4: `Decile 4 Income`, 5: `Decile 5 Income`, 6: `Decile 6 Income`,
## # 7: `Decile 7 Income`, 8: `Decile 8 Income`

#Now we use loops to complete our task. We begin by creating a new variable in our dataset, gini, which
decile_data$gini <- 0
#Now we use a loop to run through all the rows in our dataset (country-year combinations). For each row
#The function that calculates Gini coefficients from a vector of numbers is called Gini, and we apply it
# Give us the number of rows in decile_data
noc <- nrow(decile_data)
```

```

for (i in seq(1, noc)){
  # Go to Row I to get the decile data
  decs_i <- unlist(decile_data[i, 3:12])
  decile_data$gini[i] <- Gini(decs_i)
}

#With this code, we calculated 4,799 Gini coefficients without having to manually run the same command.
#First we use the subset function to select Nordic countries and save their data as temp_data. As an example
temp_data <- subset(
  decile_data, Country %in% c("United States","Sweden","Finland","Norway",
                              "Denmark"))

#Now we plot the data using ggplot.

ggplot(temp_data,
  aes(x = Year, y = gini, color = Country)) +
  geom_line(size = 1) +
  theme_bw() +
  ylab("Gini") +
  ggtitle("Gini coefficients for Nordic countries")

```

```
## Warning: Removed 11 row(s) containing missing values (geom_path).
```

### Gini coefficients for Nordic countries

*#This example is based on great webpages of CORE: <https://www.core-econ.org/doing-economics/book/text/0>*

```

# Svar
# Gini-koeffisienten måler inntektsfordelingen i befolkningen i et land.
# Gini-koeffisienten har et mål mellom 0 og 1. Der 0 er minst ulikhet og 1 er
# størst ulikhet. De nordiske landene har lavere Gini-koeffisienter enn USA

```

```
# utfra diagrammet. Det innebærer at det er lavere inntektsforskjell i disse
# landene. Vi ser at det er en del svingninger i de nordiske landene,
# men at alle hadde en stigende ulikhet fra ca. 1995. Norge har den laveste
# ulikheten med en koeffisient på ca. 0.25 ved starten av 2010-tallet,
# men alle de nordiske landene flater ut rundt den perioden. Vi ser også at
# Gini-koeffisienten i Norge økte kraftig fra 2000 til 2005, før den falt
# kraftig ned. Helsedirektoratet forklarer utmerket årsaken av den økte
# ulikheten med endring for skattelovene:
```

```
# Denne utviklingen skyldes i stor grad endringer i reglene for skatt på
# aksjeutbytte. I 2006 ble det innført skatt på mottatt utbytte, noe som førte
# til at mange tok ut store skattefrie utbytter i årene før. Siden nesten alt
# utbytte mottas av husholdningene i toppen av fordelingen, førte dette til økt
# ulikhet. Etter innføring av skatt på utbytte falt ulikheten fram til 2009.
```

# I motsetningen til Gini-koeffisienten som gir oss et spesifikk tall på  
 # ulikheten i inntektsfordelingen, så er Lorenz-kurven en grafisk fremstilling  
 # av ulikheten i inntektsfordelingen. På x-aksen blir det kumulative  
 # befolkningen satt som prosentandel. Mens den kumulative inntekten  
 # blir satt som prosentandelen. Den lineære (45 grader) linja i figuren  
 # representerer dersom ulikhet ikke eksisterer. Lorenz-kurven er dermed kurven  
 # under. Og det er området mellom den lineære linja og Lorenz-kurven som  
 # representerer størrelsen på ulikheten i inntektsfordelingen.

# Utfra figuren, har ulikheten økt svært lite i tidsrommet mellom 2005-2020.  
 # Denne økningen kan tolkes som ubetydelig og at Tromsø har ligget på stabilt  
 # nivå disse 15 årene.
